

Kala-Chakra — Cursor Handover: Golden Regression Case

GR-001 · "Satya Anand" dasha-consistency regression | Status: **RESOLVED** / expected-pass fixture
| Component: `calc_core` + `validators.py` + Judge agent

1. Purpose of this document

This is a focused engineering handover for a single, high-value regression fixture. It formalises the decoded handwritten-notes finding — that the notes and the printed PDF **agree** on Jupiter Mahadasha once computed — and turns it into an automated test that guards the platform's anti-hallucination and consistency guarantees.

Headline finding: The previously suspected conflict (handwritten "Venus 2013–2033" vs. printed PDF "Jupiter 2017–2033") was an OCR/handwriting **misread of the Mahadasha level**. Deterministic recomputation confirms **Jupiter Mahadasha 2017–2033** in both sources. "Venus" is the current **antardasha (sub-period)**, not a competing Mahadasha. GR-001 therefore asserts a **consistent** result and validates that the engine + validators reproduce it.

2. Native under test

Field	Value
Name at birth	Satya Anand Bonda
Date / time of birth	25 Nov 1977, 01:55:00 IST
Place	Kolkata, India (22.5726°N, 88.3639°E)
UT equivalent	24 Nov 1977, 20:25:00 UT
Ayanamsa	Lahiri (Chitrapaksha)

3. Expected deterministic output (assertions)

The `calc_core` (Swiss Ephemeris in production) must reproduce these values within tolerance. Reference values were produced independently via the Meeus lunar algorithm + Lahiri ayanamsa.

Assertion	Expected	Tolerance
Sidereal Moon longitude	≈ 29.27°	± 0.30°
Nakshatra	Krittika, Pada 1	exact
Rashi / Lagna family	Mesha (Aries)	exact
Birth Mahadasha lord	Sun (balance ~4.83 yrs)	± 0.1 yr
Mahadasha on 2026-06-01	Jupiter (2017-05 → 2033-05)	exact lord; dates ± 60 days
Antardasha on 2026-06-01	Venus (2025-04 → 2027-12)	exact lord; dates ± 30 days

Mahadasha ladder ends	Jupiter → 2033-05-27; Saturn → 2052-05-27	matches handwritten ladder
-----------------------	---	----------------------------

4. Input fixtures

File	Role	Handling
IMG_6601.jpeg	Cover / intro letter (Telugu cursive)	OCR-hard; route to vision fallback; low-confidence tokens flagged, never guessed.
IMG_6602.jpeg	Vimsottari dasha ladder + panchanga	Extract dasha ladder (start dates + balance Y-M-D). Key legible anchors: ...2033-05-27 → 2052-05-27.
IMG_6603.jpeg	D1 Rasi + D9 Navamsa squares + graha list + remedy prose	Extract house/planet placements. Exact degrees & remedy paragraph = low-confidence → mark, do not fabricate.
Satya Anand_HP4+pdf	Printed expert horoscope	Second source for cross-validation of Mahadasha & identity.

5. Validator behaviour under test

Critical rule (do not regress): When two ingested sources report dasha/rashi/lord information, `validators.py` must **cross-validate at the correct hierarchy level** (Mahadasha vs. Antardasha vs. Pratyantardasha) before declaring a conflict. A sub-period label appearing in one source must NOT be compared against a major-period label in another. If a genuine conflict remains after level-alignment, raise `ConsistencyFlag` and surface **both** readings to the Judge — never silently pick or guess.

- **GR-001 assertion:** after level-alignment, the notes and the PDF are **consistent** → validator returns `status = CONSISTENT`, no `ConsistencyFlag` raised.
- **Anti-regression twin (GR-001b):** feed a deliberately corrupted note ("Venus Mahadasha 2013–2033") → validator **MUST** raise `ConsistencyFlag` and hand both to the Judge. This guards the detector so it doesn't become a rubber stamp.

6. Suggested test scaffold

```
def test_GR001_satya_anand_consistency():
    chart = calc_core.compute(
        name="Satya Anand Bonda",
        dob="1977-11-25", tob="01:55:00", tz="+05:30",
        lat=22.5726, lon=88.3639, ayanamsa="lahiri")

    # identity
    assert abs(chart.moon_sidereal - 29.27) < 0.30
    assert chart.nakshatra == ("Krittika", 1)
    assert chart.rashi == "Mesha"

    # dasha at the test epoch
    md, ad = chart.dasha_at("2026-06-01")
    assert md.lord == "Jupiter"
    assert ad.lord == "Venus"
    assert md.end.year == 2033          # matches handwritten ladder

    # ingestion + validation
```

```
notes = ingest(["IMG_6602.jpeg", "IMG_6603.jpeg"])
pdf    = ingest(["Satya Anand_HP4+.pdf"])
flag   = validators.cross_validate(notes, pdf, level_align=True)
assert flag.status == "CONSISTENT" # GR-001

def test_GR001b_corrupted_note_raises_flag():
    corrupt = make_note(mahadasha=("Venus", "2013", "2033"))
    pdf      = ingest(["Satya Anand_HP4+.pdf"])
    flag     = validators.cross_validate(corrupt, pdf, level_align=True)
    assert flag.status == "CONFLICT"
    assert flag surfaced_to_judge is True
    assert {"Venus", "Jupiter"} <= set(flag.candidates)
```

7. Acceptance criteria

#	Criterion	Pass condition
AC-1	Deterministic core reproduces identity	Moon/Nakshatra/Rashi assertions pass within tolerance
AC-2	Dasha hierarchy correct	MD=Jupiter, AD=Venus at 2026-06-01; ladder ends 2033/2052
AC-3	Level-aware validation	GR-001 = CONSISTENT (no false conflict)
AC-4	Conflict detector still fires	GR-001b = CONFLICT, both candidates to Judge
AC-5	No fabrication	Illegible degrees/remedy text returned as low-confidence, never invented
AC-6	LLM never computes astronomy	All positions/dates sourced from calc_core, not the model

Why this fixture matters. GR-001 encodes the platform's two core promises in one case: (1) the deterministic core is trustworthy, and (2) the adversarial/validation layer flags real conflicts but does not manufacture false ones. It is the canonical smoke test to run on every build.
